dependencies

\$ npm i react typescript next.js react-native vite tailwind zustand tanstack-query
\$ pip install fastapi django pandas numpy celery asyncio sagemaker openai anthropic
\$ brew install aws-cli docker terraform postgresql mysql git node postman
\$ apt-get linux github-actions vercel railway jest pytest figma jira

experience

Eigennet

2024 – present

Software Engineer

- > Only engineer trusted with clearance to architect and operate a classified AWS document pipeline — **500+ deliveries/month, 99.7% success**, zero supervision
- > Built an AI extraction engine on SageMaker that reads **10K+ pages daily** at **99% accuracy** — made manual review nearly obsolete, cutting human effort by **85%**
- > Wrote the Python automation that killed **20+ hours** of weekly manual labor — metadata packaging, encryption, and SFTP delivery, fully end-to-end
- > Slashed transmission failures by **90%** with custom EC2/S3 batch orchestration and real-time API monitoring
- > Engineered the validation layer that catches bad data before it leaves the building — schema drift, anomaly flagging, zero downstream incidents

Freddie Mac

2023

Software Engineering Intern

- > Built a data-validation engine in Java that the Financial Engineering team still runs — schema drift + anomaly detection across millions of CSV rows, **60% less** reconciliation effort
- > Wired up automated alerts that **tripled** the team's bug-catch rate before anything hit production
- > Took a quarterly process that dragged on for 2 weeks and compressed it to **3 days** — fully automated what nobody thought could be automated

projects

Embark

[embark-theta.vercel.app](#)

// react + typescript + fastapi + python + supabase

- > Full RPG engine for real life — quests, XP, loot drops with rarity tiers, and a progression system that keeps **50+ users** coming back
- > Real-time everything: Supabase subscriptions, FastAPI WebSockets, live progress — no refresh needed

Cinetik

[cinetik.app](#)

// react + typescript + fastapi + python

- > The movie tracker I always wanted — TMDb integration, TanStack Query, Zustand state, PostgreSQL handling **500K+ records**
- > Responsive Tailwind UI that works on everything, deployed to production

education

George Mason University — M.S. Computer Science v2024-present

James Madison University — B.S. Computer Science v2020-2024
